                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.
THEN N-LINKED GLYCAN CONTAINS N-ACTIVILACTOSAMINE, SIALIC ACID AND IS CORE FUCOSYLATED. O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               J. Blochem. 13:57-63(1988).

FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT. TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAFIAN FOLLICLE. IT ACTIVATES THE URCHINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENAES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, CATALANININ AND VON WILLEBRAND FACTOR.

CATALATIC ACTIVITY: PREFERENTIAL CLEAVES LASS: A PAG-1-Xaa: higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINGEN SUBFAMILY.
-!- SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.

BUTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO ACTIVATORS BEING BOUND TO ACTIVATORS BEING BOUND TO ACTIVATOR BEING BOUND TO TESBRIN. ACTIVATOR BEING BOUND TO TESBRIN. ACTIVATED WITH CATLATIC AMOUNTS OF STREPTOKINASE.

MISCELLANDENGS: PLASMIN IS IRACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

MISCELLANDENGUS: IN THE PRESENCE OF THE INHIBITOR, THE ACTIVATION INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN 2 CHAINS HELD TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE STAINS HELD STIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY. SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                J. Biol. Chem. 264:5957-5965(1989).

-1- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROPEDIVITE FROTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUWOR INVASION, AND INFLAMMATION: IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE URCKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

-1- CATALTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble

                                                                                                                                                                                                                                         ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO FIBERIN. CANNOT BE ACTIVATOR NITS ACTIVATOR BEING BOUND TO PIBERIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PTW. N-LINKED GLYCAN CONTAIN N-ACETYLLACYCOSAMINE AND SIALIC ACID.

O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHRIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).

MASCELLANBOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.

SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.

                                                                DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherosciencesis. Homology with plasminogen kringles IV and V is thought to underlie the atherosenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding. MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-Lp(a). Apo(a) fragments accumulate in atheroscierotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of
                                                                                                                                                                                                                                                                                       proteolytic fragmentation (By similarity).

Hepatocyte growth factor HGF.
Felis silvestris catus (Cat).
Evkaryota: Metazoa: Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Carnivora; Fissipedia; Felidae; Felis.

Kobayashi Y., Nakamura N., Ishizaka T., Masuda K., Ohno K., Tsujimoto H.;
"Molecular cloning of feline hepatocyte growth factor (HGF) cDNA.";
Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
-:-SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY.

The factor binds the comet receptor and induces cell dissociation but not mitogenesis.";
Proc. Natl. Acad. Sci. U.S.A. 89:11574-11578 (1992).
C -!- FUNCTION: HGF IS A POTENT MITOGEN FOR MATURE PARENCHYMAL HEPATOCYTE CELLS, SEEMS TO BE AN HEPATOTROPHIC FACTOR, AND ACTS AS GROWTH FACTOR FOR A BROAD SPECTRUM OF TISSUES AND CELL TYPES. IT HS NO DETECTABLE PROTEASE ACTIVITY.
C -!- SIMILARITY: HIGH, TO OTHER HGF; LOWER, TO PLASMINOGEN.
